

# Ratios and Proportions

# Ratios

- Ratio is a comparison of two numbers.
- Ratios can be written in several ways.

→ as a fraction

→ using the word “to” (or)

→ a semi colon [ : ] .

For Example : Express the ratio of yellow stars to blue stars in the 3 ways

\* as a fraction →  $\frac{4}{7}$

\* using the word “to” → 4 to 7

\* using a semi colon → 4:7

- Ratios are not just comparing two numbers.
- We should see that, the two numbers have same units.
- Only if they possess same units, then ratios can be found.

For example :

(i) The ratio of 16 ounces to 9 ounces

**16 : 9**

(ii) The ratio of 1 foot and 17 inches

**1 foot = 12 inches**

Therefore, the ratio should be expressed between 12inches and 17inches.

**12:17**

**Note : Order is important for the ratios.**

For Example : 13:16 is not equal to 16:13

If we need to find the ratio between 3feet to 2feet, then the ratio is 3:2 and not 2:3.

# Equivalent Ratio

- Equivalent Ratio can be obtained by multiplying the terms of the ratio by the same number.

For example : Find the equivalent ratio for  $5/6$

Multiply the terms of the ratio by 2 , 3 , 4 .....

we will get  $10/12$ ,  $15/18$ ,  $20/24$ , .....

Therefore, the equivalent ratios for  $5/6$  are  $10/12$  ,  $15/18$ ,  
 $20/24$  , .....

# Comparison Ratios

Two ratios  $a/b$  and  $c/d$  can be compared using the method of cross multiplication.

**If  $ad = bc$  , then ratios are equal.**

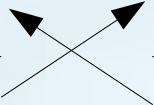

**If  $ad > bc$  , then  $a/b > c/d$**

**If  $ad < bc$  , then  $a/b < c/d$**

→ **Example** : In test 1, Tom gets 19 correct out of 25 questions. In test 2, he gets 11 correct out of 15 questions. Find which score is better?

Solution : Test 1 =  $19/25$

Test 2 =  $11/15$

Compare the ratios :  $\frac{19}{25}$    $\frac{11}{15}$

$$= 285 > 275$$

Therefore  $19/25 > 11/15$

**Hence, Test 1 is better than Test 2.**

## Examples

1) A score of 72 points was shared by 3 players in a basket ball team , in the ratio 1:2:3. How many points did each player score?

Given : Scores are in the ratio 1:2:3

The sum of ratios will be 6

Total scores = 72 points.

Solution : Score of first player =  $72 \times \frac{1}{6} = \mathbf{12\text{points}}$

Score of second player =  $72 \times \frac{2}{6} = \mathbf{24\text{points}}$

Score of third player =  $72 \times \frac{3}{6} = \mathbf{36 \text{ points.}}$

2)The ratio of Johnny's age to his mother's age is 1:3. If his mother's age is 33, then how old is Johnny.

Given : Johnny's age : His mother's age = 1:3

Mother's age = 33 years

**Note : In this question, we are not considering the total ratio, because, we do not know, the total age of Johnny and his mother.**

Solution :

Johnny's age = [ Mother's age x (his ratio / Mother's ratio)]

Johnny's age =  $33 \times \frac{1}{3} = 11$  years.

# Proportions

- Proportion is an equation stating that two ratios are equal.
- For finding the equality, we should compare the ratios .
- Proportion can be expressed in 2 ways.

→ by fraction

→ ratio notation

- **If 3:2 equal to 9:6, it can be expressed as**

\* fraction →  $\frac{3}{2} = \frac{9}{6}$

\* ratio notation →  $3:2 :: 9:6$

$$\begin{array}{ccccccc} 3 & : & 2 & :: & 9 & : & 6 \\ & & \underbrace{\hspace{1.5cm}} & & & & \\ & & \text{Means} & & & & \\ & \underbrace{\hspace{2.5cm}} & & & \underbrace{\hspace{2.5cm}} & & \\ & \text{Extremes} & & & \text{Extremes} & & \end{array}$$

Two ratios are said to be in proportion, only if  
**product of extremes = product of means**

In the above ratio, product of extremes =  $3 \times 6 = 18$  and  
product of means =  $2 \times 9 = 18$

Therefore,  $3:2 :: 9:6$  is said to be a proportion.

**Note :** If only three numbers in the proportion are known,  
then we can find the fourth number by using  
**product of extremes = product of means.**

### Let us consider the same example

The ratio of Johny's age to his mother's age is 1:3. If his mother's age is 33, then how old is Johny.

Given : Ratio of Johny's age : Ratio of his mother's age = 1 : 3

His mother's age = 33

To Find : Johny's age.

Solution : This can be written as

$$\begin{array}{c} \text{Johny's age : 33 :: 1 : 3} \\ \left[ \begin{array}{c} \text{Means} \\ \text{Extremes} \end{array} \right] \end{array}$$

product of extremes= product of means

$$\text{John's age} \times 3 = 33 \times 1$$

Therefore John's age = **11 years.**

## Quiz

Send you solutions to [support@greedge.com](mailto:support@greedge.com)

- 1) If in your class, there are 34 girls and 43 boys, then express the ratio between boys and girls ?
- 2) What value of  $n$  will make this a proportion ,  $6 / 15 = n / 25$
- 3)

Column A	Column B
2 inches to 4 inches	2 foot to 72 inches
- 4) A score of 72 points was shared by 3 players in a basket ball team in the ratio 2:3:4. How many more points did the highest scorer score compared to the lowest scorer?
- 5) 4 cups of tea contains milk and water in the ratio 3 : 1. How much of milk is used to prepare 4 cups of tea?

6) Find 3 equivalent ratios for  $\frac{1}{5}$  ?

7) Find whether the ratios are equal ,  $\frac{4}{5} = \frac{5}{6}$

8)Angles of the triangle are in the ratio 3:4:5. Find the angles?

9) Two cars consume petrol in the ratio 4:5. If both the cars covers the same distance and the second car consumes 25 liters. Find how much petrol the first car uses?

10)      Column A

$\frac{45}{55}$

Column B

$\frac{42}{56}$
